

# Status of the AIRS-RTA

L. Strow, S. Hannon, S. De-Souza Machado, H. Motteler

- Concentrate first on the water vapor continuum
  - Fix the lower altitude channels first, then work our way up in the atmosphere
- What is the truth?
- Procedures to validate, improve the water continuum
- Error analysis, including ECMWF fields
- Fixed gas/CO<sub>2</sub> tuning, preliminary results
  - Again, truth is the problem, especially in the upper atmosphere
- Future work

## Starting Point - H<sub>2</sub>O Continuum

- January 2003 RTA quickly modified from theory based on ~1 month of validation data from Fall 2002.
- Main modifications at that time were to the water vapor continuum, primarily based on ECMWF model fields.
- Basis of changes: minimize the dependence of the bias on total column water;
  - Suggested large changes in shortwave continuum, which were implemented beyond 2400 cm<sup>-1</sup>.
  - Longwave continuum was also increased for the same reason.
- Used MT\_CKD(V1) as the starting point for validation, released Spring 2003, changes based on DOE-ARM Aeri work by U.Wisc.
- ARM-TWP has lots of water (~40 mm), and a reasonable number of "clear" overpasses.
- Goal: Agreement between AERI, AIRS-TWP, AIRS-ECMWF

# Approach to Water Continuum

- Starting Point: MT\_CKD continuum released Spring 2003
- Use AIRS-TWP observations as basis for validation of RTA
  - Over ocean, good emissivity
  - Lot's of water
  - Reasonable number of "clear" observations
  - RS-90 sondes with microwave scaling for total column water
  - Determine SST with "2616 cm<sup>-1</sup>" channel, **but** MT\_CKD gave large biases there even though the continuum is small in this region
  - (1) Bootstrap with ECMWF-derived "2616 cm<sup>-1</sup>" bias, and/or (2) Analyze AERI shortwave data for continuum (Thanks to D. Turner and D. Tobin for the data!)
  - Once get SST, derive continuum using AIRS-TWP data
- Apply AERI, TWP continua to ECMWF, "calibrate" ECMWF statistical global column water
- Re-analyze AERI raw data using variation in radiance with total column water - MT\_CKD only used AERI data at ~40 mm total column water
- Choose "best" continuum

# Strength of Water Continuum, ARM-TWP

# ARM-TWP Biases using Continua from 2 Analyses of AERI Data

## Lower Troposphere Water Vapor Measurement Goal: <2% in precipitable water vapor

Based on desire to improve clear sky absorption models and to resolve significant climate changes, such as the effect of CO<sub>2</sub> doubling on surface radiation budget.

For midlatitude conditions, a 10% H<sub>2</sub>O perturbation results in a ~7 W/m<sup>2</sup> change in downwelling Flux at the surface.

2% is order (1 W/m<sup>2</sup>)

# Bias for 1K ECMWF Offset above 60 mbar

# Fixed Gas Tuning

- Set SST in shortwave
- Modified fixed-gas optical depth with ARM-TWP
- Strong water channels not touched
- No fixed-gas tuning above 60 mbar

# Fixed Gas Multipliers from TWP

- Trial fixed gas optical depth multipliers were generated using the ARM-TWP AIRS validation data.
- Longwave multipliers are reasonable
- $2400 \text{ cm}^{-1}$  multipliers seem a little large

# MT\_CKD Continuum Multipliers

Water Continuum Multipliers

- These results based on AIRS-TWP validation data in longwave, TWP and ECMWF shortwave
- Longwave multipliers agree with UMBC-AERI results below 1000  $\text{cm}^{-1}$
- Still working to merge TWP and AERI in 2400  $\text{cm}^{-1}$  region, we are close. Linear vs quadratic?

0.3K vs 0.15K Uniformity Threshold

# Bias vs Wind Speed and Total Column Water

# ECMWF Wind Speed in Masuda $\varepsilon$

Masuda wpeed = 0

Masuda wspeed = ECMWF

# Upper Trop Water RTA Validation Remains

AWEX may help, already have good agreement between  
ARM-SGP, Voemel, and ECMWF (between lines)

# ARM-SGP vs ECMWF Global Biases in H2O-sounding Channels

# Future Work

- Pick next water continuum:
  - MT\_CKD with shortwave mods by UMBC *or*
  - Continuum based on AIRS co-locations with ARM-TWP sondes
  - Both models supplemented with ECMWF in extreme shortwave
  - Test with other months (Oct. 2002 done, very similar to March 2003)
  - Do high continuum values near  $\text{CO}_2$  make physical sense?  $\text{CO}_2\text{-H}_2\text{O}$  collisions?
- Mid-wave/Upper-trop water. Awaiting ARM-CARL data and AWEX campaign results. Try our new near-wing water lineshape?
- Fixed gas modifications
  - Do RS-90's justify these mods
  - No tuning above ~60 mbar, is ECMWF biases there?
  - Any data around to test these altitudes? Limb sounders?
- Determine source of  $2200\text{ cm}^{-1}$  bias,  $\text{N}_2\text{O}$ ?
